

## **New functions and metrics in DB2 V12 accounting and statistics**

*Fabio Massimo Ottaviani – EPV Technologies*

February 2017

### **1 Introduction**

DB2 V12 provides new and modified functions designed to greatly improve DB2 applications performance. As often happens, most of them need more real memory to be exploited.

Together with these enhancements, DB2 also provides new metrics collected into new or existing IFCIDs.

In this paper, we will discuss the metrics you can use to control some of the most important new functions such as:

- in-memory contiguous buffer pools;
- index Fast Traverse Block;
- fast insert.
